GSI Insights
Q2 2020 – Q2 2022

Presented to WA Gas Consultative Forum

By Madison Pigliardo, WA Market Operations

20 July 2022

Gas consumption trends

- Gas consumption by user category tends to be stable, increasing in winter months due to higher distribution, industrial and electricity gas usage.
- Month to month consumption fluctuates more due to outages at large user facilities, along with changes in monthly electricity demand; June 2022 saw a 53% increase in gas use for electricity compared to May.

Gas production trends

- Long-term trends in gas production mirror those of consumption, with total production peaking in winter.
- Differences between gas production and consumption are reflected in changes to net storage.

Storage

- For the first time since Q3 2020, gas storage facilities had a net inflow into storage in Q1 2022.
- This did not continue in Q2, with both storage facilities having net storage outflows during the quarter. This can be attributed to consumption increasing by 4.8 PJ more than production.
