## 13. SUBSTITUTION FOR TRANSFER

| 13.1. Application | 42 |
| 13.2. Manually Read Interval Metering Installations | 42 |
| 13.3. Manually Read Accumulation Metering Installations | 43 |
1. **INTRODUCTION**

1.1. **Purpose and Scope**

This is the Metrology Procedure: Part B made under clause 7.16.3, 7.16.4 and 7.16.5 of the NER (Procedure), which addresses the Validation, Substitution and Estimation of *metering data*.

This Procedure has effect only for the purposes set out in the NER. The NER and the *National Electricity Law* prevail over this Procedure to the extent of any inconsistency.

1.2. **Definitions and Interpretation**

The Retail Electricity Market Procedures – Glossary and Framework:

(a) is incorporated into and forms part of this Procedure; and

(b) should be read with this Procedure.

1.3. **Related AEMO Documents**

<table>
<thead>
<tr>
<th>Title</th>
<th>Location</th>
</tr>
</thead>
</table>

2. **PRINCIPLES FOR VALIDATION, SUBSTITUTION AND ESTIMATION**

2.1. **General Validation, Substitution and Estimation Requirements**

The principles to be applied to Validation, Substitution and Estimation in the *NEM* include the following:

(a) The MC must coordinate the resolution of issues arising from the non-performance of *metering systems*, including any liaison with associated *Registered Participants*, MP(s), MDP(s), and ENM(s). The MC must respond promptly to requests for remedial action from the MDP or AEMO.

(b) The MDP must identify *metering data errors* resulting from data collection and processing operations using Validation processes in accordance with this Procedure.

(c) The MDP must apply Substitutions in accordance with this Procedure to ensure that *metering data* is delivered to AEMO and *Registered Participants*.

2.2. **Substitution requirement**

The MDP must undertake Substitutions on behalf of AEMO or the MC, as appropriate, in a manner consistent with this Procedure. Substitutions may be required in the following circumstances:

(a) Where the system or equipment supporting the remote or manual collection of *metering data* has failed or is faulty.

(b) Where the *metering installation* for a *connection point* has failed or is removed from service.

(c) To enable timely provision of *metering data* to AEMO for *settlements* purposes.

(d) In situations where *metering data* has been irretrievably lost.
(e) Where the metering data is found to be erroneous or incomplete.

(f) Where metering data has not completed Validation as part of the registration or transfer of a connection point.

(g) Where metering data has failed or has not completed the Validation process.

(h) Where metering data cannot be obtained in the performance timeframes required for the data period in question:
   (i) metering data for metering installations with remote acquisition must be Substituted if metering data cannot be obtained to meet either settlements timeframes or the required performance of the applicable Service Level Procedure (MDP).
   (ii) metering data for manually read metering installations must be Substituted if metering data cannot be obtained on or within the expected timeframe of the NSRD for a connection point. Any historical or previous estimated metering data must be replaced with substituted metering data.

(i) When an inspection or test on the metering installation establishes that a measurement error exists due to a metering installation fault.

(j) When the affected FRMP, LR, and LNSP have all agreed and subsequently informed the MDP that a previous Substitution was inaccurate and that a re-Substitution of metering data is required.

(k) When an inspection or test on the respective algorithms, Inventory Table, Load Table or On/Off Table for calculated metering data establishes that an error exists in the metering data calculation or when a more accurate Inventory Table becomes available.

(l) Where the metering data calculation has failed the Validation tests for a metering installation with calculated metering data.

(m) In situations involving Meter Churn.

(n) In response to End User transfers following a RoLR Event.

2.3. Estimation Requirement

The MDP must undertake Estimations on behalf of the MC in a manner consistent with this Procedure. Estimations may be required in the following circumstances:

(a) Routinely for a period equal to or just greater than the period to the NSRD or another forward period.

(b) In response to End User transfers authorised by a Jurisdiction or RoLR Events, as outlined in section 13.

(c) Where the current published Scheduled Reading Date has changed due to a revised scheduled reading route and the existing estimated metering data does not extend to or beyond the revised NSRD, the MDP must adjust the estimated metering data for the revised NSRD.

This section only applies to the Jurisdiction specified in the following table:

<table>
<thead>
<tr>
<th>Jurisdiction</th>
<th>Variation in accordance with jurisdictional policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Victoria</td>
<td>Where metering data for a type 5 metering installation is collected more frequently than required by Metrology Procedure Part A. Estimations need not be provided routinely or as a result of a change to the current published Scheduled Reading Date. Estimations must, however, be provided where necessary to meet the data requirements of Schedule 8 of the Service Level required for Metering Data Collection, Processing and Delivery Services for Metering Provider category 5D, 6D and 7D, but are not required to be for a period to the next Scheduled Reading Date.</td>
</tr>
</tbody>
</table>

Note: The effective date of this Jurisdictional provision is 1 July 2009. The review date of this Jurisdictional provision is 31 December 2017.

2.4. Metering Data Quality Flags

MDPs must assign the relevant metering data quality flags to metering data as follows:
2.6. Summary Table of Substitution and Estimation Types

</tbody>
</table>

Unless specified otherwise in this Procedure, MDPs must apply the following quality flag rules in the *metering data services database*:

- ‘A’ *metering data* can only be replaced with ‘A’, ‘S’ or ‘F’ *metering data*.
- ‘S’ *metering data* can only be replaced with ‘A’, ‘S’ or ‘F’ *metering data*.
- ‘E’ *metering data* can only be replaced with ‘A’, ‘E’, ‘S’ or ‘F’ *metering data*.
- ‘F’ *metering data* can only be replaced with ‘F’ *metering data* as per section 2.5.1(f) or ‘A’ *metering data* as per section 2.5.1(b) or 2.5.1(h).

2.5. Final Substitution

The MDP must undertake final Substitutions in the following circumstances:

(a) Where a notice has been received from either the MC or the MP detailing a failure of the *metering installation* that affects the quality of the *energy data*.

(b) If Actual Metering Data is unexpectedly recovered from the *metering installation* and a final Substitution has been undertaken in accordance with paragraph (a), the MDP must replace the final *substituted metering data* with the Actual Metering Data and maintain a record of the reason.

(c) Where the MDP must undertake final Substitutions following a Meter Churn.

(d) Where the MDP has received a notice that the affected FRMP, LR and LNSP have agreed that the *metering data* is erroneous and that a final Substitution is required.

(e) As a result of a RoLR Event or where a Jurisdiction has requested AEMO to undertake End User transfers requiring the provision of Substitutions and Final Readings.

(f) The MDP may undertake to replace existing final *substituted metering data* with new final *substituted metering data* in accordance with this Procedure.

(g) Where the MDP has found Actual Metering Data to be erroneous.

(h) The MDP may replace type 6 final *substituted metering data* with accumulated *metering data* that spans consecutive Meter Readings.
3. SUBSTITUTION FOR METERING INSTALLATIONS WITH REMOTE ACQUISITION OF METERING DATA

3.1. Application of section 3
For metering installations with remote acquisition installed in accordance with clause 7.8.9(b) of the NER, the MDP may perform Substitutions in accordance with section 4. For all other metering installations with remote acquisition, the MDP must perform Substitutions in accordance with section 3.

3.2. Substitution Rules
The MDP must apply the following rules when performing a Substitution:

(a) The MDP must obtain clear and concise identification as to the cause of any missing or erroneous metering data for which Substitutions are required.

(b) The MDP must undertake to do a type 11 Substitution and use metering data obtained from any check metering installation associated with the connection point as the first choice considered for the source of metering data for any Substitutions undertaken.

(c) SCADA data, where available, may be used by the MDP as check metering data for Substitutions.

(d) The MDP may only undertake Substitution type 13 where Substitution types 11 and 12 are not applicable or cannot be carried out.

(e) For connection points where the FRMP is either a Generator or MSGA:
   (i) MDPs may directly undertake type 11, type 12 or type 13 Substitutions if metering data has failed Validation.
   (ii) MDPs may undertake type 16 or 18 Substitutions following consultation and agreement with the affected Generator or MSGA that the substituted metering data is an accurate reflection of the interval metering data concerned.
(iii) If metering data cannot be collected from a metering installation or Substituted within the required timeframes, the MDP must undertake type 19 Substitutions as an interim until metering data can be collected from the metering installation or Substituted.

(f) The MDP may only undertake Substitution types 14, 15, 16, 17, 18, 19 or 20 where Substitution types 11, 12 and 13 are not applicable or cannot be carried out.

(g) The MDP may perform all Substitution types except type 16 or 18 without the agreement of the affected FRMP, LNSP or LR. MDPs may change the quality flag to an existing type 16 or 18 Substitution without seeking further agreement from those parties.

(h) The MDP must notify the LNSP, LR and the FRMP for the connection point of any Substitution within two business days of the Substitution being carried out. Notification is to be achieved via the Participant metering data file as detailed in the MDFF.

(i) Where there is a metering installation malfunction that cannot be repaired within the periods specified in clause 7.8.10 of the NER, the MDP must:

   (i) Where the metering installation malfunction is due to a failure of the meter to correctly record interval energy data and the MC has been granted an exemption to repair the metering installation, the MDP must Substitute the missing metering data in accordance with this Procedure;

   (ii) For type 1-3 metering installations and other instrument transformer connected metering installations, and where a metering installation malfunction is due to a failure of the remote acquisition system, arrange for an alternative method for the collection of metering data from the metering installation in a timeframe that ensures the MDP complies with metering data delivery requirements; or

   (iii) For non-instrument transformer connected metering installations, and where a metering installation malfunction is due to a failure of the remote acquisition system, the MDP must Substitute the missing metering data in accordance with this Procedure.

(j) The MDP must ensure that all substituted metering data is replaced with Actual Metering Data when it becomes available.

(k) For VICAMI Meters, the MDP may also use Substitution types 51 and 52, as detailed in section 4.

3.3. Substitution Types

3.3.1. Type 11 – Check Data

To perform a type 11 Substitution, the MDP must use interval metering data obtained from the check metering installation for that metering point where:

(a) the metering installation and check metering installation are installed at the same connection point;

(b) the metering installation and check metering installation are installed on different ends of a transmission line where the difference due to transmission line losses can be accurately determined; or

(c) the metering installation and the check metering installation are installed across a parallel set of feeders having similar line impedances between a common set of busbars.

3.3.2. Type 12 - Calculated

To perform a type 12 Substitution, the MDP must calculate the interval metering data to be Substituted where they relate to a single unknown feed to a node based on the other known energy flows to or from that node.

3.3.3. Type 13 - SCADA

To perform a type 13 Substitution:

(a) The MDP must use SCADA data provided by AEMO in the agreed format for Substitution purposes, which originates from a similar measurement point as the meter.
Where SCADA data is inferior in accuracy or resolution and in a dissimilar format to the metering data, (e.g. 30 Min. demand values). The MDP may have to adjust the data in both magnitude and form so that the Substitution is valid.

(c) Where SCADA data is to be used for Substitution, both the provided ‘E’ channel and ‘B’ channel SCADA Datastreams must be used.

3.3.4. Type 14 - Like Day

To perform a type 14 Substitution, the MDP must Substitute missing or erroneous metering data using the nearest equivalent day or like day method, as detailed in Table 1.

Table 1

<table>
<thead>
<tr>
<th>Substitution Day</th>
<th>Nearest Equivalent Day or Like Day (in order of availability)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td>Monday##</td>
</tr>
<tr>

</tr>
<tr>
<td>Friday</td>
<td>Friday##</td>
</tr>
<tr>
<td>Saturday</td>
<td>Saturday##</td>
</tr>
<tr>
<td>Sunday</td>
<td>Sunday##</td>
</tr>
</tbody>
</table>

Substitutions for like day to be as detailed above, unless:
(a) No metering data is available on the first listed day, the next listed preferred day is to be used. If there is no other suitable listed day, or no metering data is available on any of the listed days type 15 Substitution must be used.
(b) The Substitution day was a public holiday, in which case the most recent Sunday is to be used.
(c) The Substitution day was not a public holiday and the listed day is a public holiday, then the next listed preferred day that is not a public holiday is to be used.

# Occurring in the same week as the Substitution day.
## Occurring in the week preceding that in which the Substitution day occurs

3.3.5. Type 15 - Average Like Day

To perform a type 15 Substitution, the MDP may Substitute for the missing or erroneous metering data using the average like day method, as detailed in Table 2.

Table 2

<table>
<thead>
<tr>
<th>Type 15</th>
</tr>
</thead>
</table>
| The interval metering data to be Substituted will be calculated using an average of the metering data from each corresponding Interval from the preceding four weeks, or any part of those. This averaging technique may be applied in either of the following ways:
(a) Where the averaged interval metering data is used to provide the value for the metering data requiring Substitution.
(b) Where the averaged interval metering data is used to provide the profile and is scaled to a pre-determined consumption value for the metering data to be Substituted.
Type 15 Substitutions must not be used for public holidays.

3.3.6. Type 16 - Agreed Method

Where the MDP is required to undertake Substitution for any period greater than seven days for type 1-3 metering installations or greater than fifteen days for other metering installation types, the MDP must consult and use reasonable endeavours to reach an agreement with the FRMP, LR and the LNSP for the connection point. This may include changes to existing Substitutions for any period where those affected parties have directed that as a result of Site or End User information, the original Substitutions are in error and a correction is required.

3.3.7. Type 17 - Linear Interpolation

To perform a type 17 Substitution, the MDP may Substitute metering data for consecutive intervals up to, but not exceeding two hours, by using simple linear interpolation.
3.3.8. Type 18 - Alternative

To perform a type 18 Substitution, the MDP may use an alternative method of Substitution subject to agreement with the FRMP, the LR and the LNSP for the connection point. The specifics of this Substitution type may involve a globally applied method or a method where an adjusted profile is used to take into account local conditions that affect consumption (e.g. local holiday or End User shutdown), or where alternative metering data may be available for quality checks and minor adjustments of an estimated profile, such as using metering register data.

3.3.9. Type 19 - Zero

The MDP must undertake Substitutions of ‘zero’ where:

(a) either the LNSP or the MP has informed the MDP of a de-energised connection point or an inactive meter and where the consumption is reasonably believed to be zero;

(b) following a Meter Churn, where the Current MDP has no access to Historical Data and the previous MDP has yet to provide metering data for the start of the Meter Churn day; or

(c) substitutions are applicable for connection points where the FRMP is either a Generator or MSGA in accordance with section 3.2.

3.3.10. Type 20 - Churn Correction

Where an MDP applies a type 19 Substitution following a Meter Churn and the previous MDP has not provided metering data for the start of the Meter Churn day the Current MDP may, at a time after the Meter Churn day, use the nearest equivalent day or like day, as detailed in Table 3, and apply that metering data retrospectively to the start of the Meter Churn day.

Table 3

| TYPE 20 |
|---|---|
| Churn Day | Nearest Equivalent Day or Like Day (in order of availability) |
| Monday | Monday## Monday### |
| Tuesday | Tuesday## Wednesday## Thursday## Thursday## Tuesday## |
| Wednesday | Wednesday## Thursday## Thursday## Tuesday## Wednesday## |
| Thursday | Thursday## Wednesday## Tuesday## Thursday## |
| Friday | Friday## Friday## |
| Saturday | Saturday## Saturday### |
| Sunday | Sunday## Sunday### |

Substitutions for like day to be as detailed above, unless:

(a) The Churn day was a public holiday, then the earliest Sunday after the Churn day is to be used.

(b) The Churn day was not a public holiday and the listed day is a public holiday, then the next listed preferred day that is not a public holiday is to be used.

# Occurring in the same week as the Churn day.

## Occurring in the week after the Churn day.

### Occurring in the second week after the Churn day.

4. SUBSTITUTION AND ESTIMATION FOR MANUALLY READ INTERVAL METERING INSTALLATIONS

4.1. Application of section 4

(a) The Substitution and Estimation requirements in this section 4 are only to be used for metering installations where:

(i) interval metering data is manually collected as a Scheduled Meter Reading; or

(ii) the metering installations have been installed with remote acquisition in accordance with clause 7.8.9(b) of the NER.
(b) Where remote acquisition of metering data has failed at the metering installation and manual collection of interval metering data is required, the Substitution requirements specified in section 3 apply.

4.2. Substitution and Estimation Rules

(a) The MDP must ensure that all substituted metering data and estimated metering data are replaced with Actual Metering Data when it becomes available.

(b) The MDP must obtain clear and concise identification as to the cause of any missing or erroneous metering data for which Substitutions are required.

(c) Where there is a metering installation malfunction that cannot be repaired within the periods specified in the NER, the MDP must Substitute the missing metering data in accordance with this Procedure.

(d) The MDP must only apply the following Substitution and Estimation types:

(i) Substitutions: type 51, 52, 53, 54, 55, 56, 57 or 58.

(ii) Estimations: type 51, 52, 56, 57 or 58.

(e) The MDP must only use type 56 or 57 Substitutions or Estimations where the Historical Data does not support the application of a type 51 or 52 Substitution or Estimation.

(f) The MDP must notify the LNSP, the LR and the FRMP for the connection point of any Substitution or Estimation within two business days of the Substitution. Notification is to be achieved via the Participant metering data file as detailed in the MDFF.

(g) MDPs must not perform type 53 or 55 Substitutions or type 56 Substitutions or Estimations without the agreement of the LNSP, the LR and the FRMP for the connection point. MDPs may change the quality flag to an existing type 53 or 55 Substitution or type 56 Substitution or Estimation without seeking further agreement from those parties.

4.3. Substitution and Estimation Types

4.3.1. Type 51 - Previous Years Method (Nearest Equivalent Day or Like Day)

To perform a type 51 Substitution, the MDP must provide a Substitute or Estimate using the metering data from the nearest equivalent day or like day from the same, or similar, Meter Reading period in the previous year. The nearest equivalent day or like day is to be determined from Table 3.

4.3.2. Type 52 - Previous Meter Reading Method (Nearest Equivalent Day or Like Day method)

(a) To perform a type 52 Substitution, the MDP must Substitute or Estimate using the metering data from the nearest equivalent day or like day from the previous Meter Reading period. The nearest equivalent day or like day is to be determined from Table 4.

Table 4

<table>
<thead>
<tr>
<th>Type 51 or 52</th>
<th>Nearest Equivalent Day or Like Day (in order of availability)</th>

<tr>
<td>Friday</td>
<td>Friday## Friday##</td>
</tr>
<tr>
<td>Saturday</td>
<td>Saturday## Saturday##</td>
</tr>
<tr>
<td>Sunday</td>
<td>Sunday## Sunday##</td>
</tr>
</tbody>
</table>

Substitutions or Estimations for like day to be as detailed above, unless:

a) No metering data is available on the first listed day, the next listed preferred day is to be used. If there is no other suitable day, or no metering data is available on any of the listed days type 52 must be used.

b) The Substitution or Estimation day was a public holiday, in which case the most recent Sunday is to be used.
4.3.3. Type 53 - Revision of Substituted Metering Data

To perform a type 53 Substitution, the MDP must re-Substitute or change substituted metering data to collecting an Actual Meter Reading or prior to the date referred to as R2 in the Data Delivery Calendar (whichever occurs first), where the FRMP, the LR and the LNSP have agreed, on the basis of Site or End User information that the original substituted metering data is in error and a correction is required.

4.3.4. Type 54 - Linear Interpolation

To perform a type 54 Substitution, the MDP may Substitute metering data for intervals up to, but not exceeding two hours, by using simple linear interpolation.

4.3.5. Type 55 - Agreed Substitution Method

To perform a type 55 Substitution, the MDP may undertake to use another method of Substitution (which may be a modification of an existing Substitution type), where none of the existing Substitution types apply, subject to using reasonable endeavours to form an agreement with the FRMP, LR and LNSP for the connection point. The specifics of this Substitution type may involve a globally applied method.

4.3.6. Type 56 - Prior To First Reading - Agreed Method

Prior to the first Actual Meter Reading and where no Historical Data exists for the connection point, the MDP may provide a Substitution or Estimation for the interval metering data using a method agreed between the FRMP, the LR and the LNSP.

4.3.7. Type 57 - Prior to First Reading - Customer Class Method

Prior to the first Actual Meter Reading and where no Historical Data exists for the connection point, the MDP may provide a Substitute or Estimate for the metering data based on the given ADL. The interval metering data must be profiled to suit the relevant End User class. MDPs electing to undertake this type of Substitute or Estimate must develop a suite of profiles acceptable to the MC for use and application.

4.3.8. Type 58 - Zero

The MDP must undertake Substitutions or Estimations of ‘zero’ where:

(a) either the LNSP or the MP has informed the MDP of a de-energised connection point or an inactive meter and where the consumption is known to be zero; or

(b) following a Meter Churn.
5. SUBSTITUTION AND ESTIMATION FOR METERING INSTALLATIONS WITH ACCUMULATED METERING DATA

5.1. Application of section 5
The Substitution and Estimation types detailed in sections 5.2 and 5.3 are to be undertaken by MDPs accredited for the collection, processing and delivery of accumulated metering data.

5.2. Substitution and Estimation Rules

5.2.1. Replacing Estimated Metering Data
(a) The MDP must replace all estimated metering data with either Actual Metering Data or substituted metering data:
   (i) when Actual Metering Data covering all or part of the Estimation period is obtained;
   (ii) when the Scheduled Meter Reading could not be undertaken, the MDP must replace the estimated metering data with substituted metering data with a quality flag of 'F'; or
   (iii) when the Scheduled Meter Reading could not be undertaken, the MDP must replace the estimated metering data with substituted metering data with a quality flag of 'F' unless it was identified that the metering installation no longer has an Accumulation Meter installed, in which case a quality flag of 'S' may be used.

(b) Any final substituted metering data provided by the MDP must be re-Validated, updated or recalculated by the MDP when:
   (i) the value of the metering data obtained at the next Actual Meter Reading is found to be less than the previous final Substitution; or
   (ii) the final Substituted value is disputed and following consultation and agreement with the FRMP, LR and the LNSP for the connection point, the new agreed value will be determined using type 64 Substitution.

(c) The MDP must obtain clear and concise identification as to the cause of any missing or erroneous metering data for which Substitutions are required.

(d) The MDP may apply the following Substitution and Estimation types:
   (i) Substitutions: type 61, 62, 63, 64, 65, 66, 67 or 68.
   (ii) Estimations: type 61, 62, 63, 65 or 68.

5.2.2. When to use Type 62 Substitution
Where the Scheduled Meter Reading cycle is less frequent than monthly, the MDP may only use a type 62 Substitution or Estimation method when metering data from the same, or similar, Meter Reading period last year (i.e. type 61) is not available.

5.2.3. When to use Type 63 Substitution
The MDP may use type 63 Substitutions or Estimations only when the metering data from the same, or similar, Meter Reading period last year and metering data from the previous Meter Reading period is not available (i.e. when type 61 and type 62 Substitution or Estimation methods cannot be used).

5.2.4. When to use Type 65 Substitution
The MDP may use type 65 Substitutions or Estimations only when the metering data from the same, or similar, Meter Reading period last year or the metering data from the previous Meter Reading period is not available (i.e. when type 61 and type 62 Substitution or Estimation methods cannot be used).

5.2.5. When to use Type 67 Substitution
The MDP must only use a type 67 Substitution when:
   (a) Directed by the MC;
   (b) Not expressly disallowed in the Jurisdiction concerned;
(c) The End User provided Meter Reading meets the Validation rules for that Datastream; or
(d) The MDP has no Actual Metering Data.

5.2.6. When to use Type 64 or 66 Substitution

(a) MDPs must not perform type 64 or 66 Substitutions without seeking the agreement of the FRMP, LR and the LNSP for the connection point. MDPs may, however, undertake to change the quality flag to an existing type 64 or 66 Substitution without seeking further agreement from those parties.

(b) The MDP must notify the LNSP, LR and FRMP for the connection point of any Substitution or Estimation within two business days of the Substitution or Estimation. Notification is achieved via the Participant metering data file as detailed within the service level procedures.

5.3. Substitution and Estimation Types

5.3.1. Type 61 - Previous Year Method (Average Daily Consumption method)

To perform a type 61 Substitution, the MDP must provide a Substitution or Estimation of the Meter Reading by calculating the energy consumption as per the following formula:

\[
\text{Energy Consumption} = \text{ADC}_{\text{LY}} \times \text{number of days required}
\]

where

\[
\text{ADC}_{\text{LY}} = \text{average daily consumption from the same or similar Meter Reading period last year.}
\]

5.3.2. Type 62 - Previous Meter Reading Method (Average Daily Consumption Method)

To perform a type 62 Substitution, the MDP must provide a Substitution or Estimation of the Meter Reading by calculating the energy consumption as per the following formula:

\[
\text{Energy Consumption} = \text{ADC}_{\text{PP}} \times \text{number of days required.}
\]

where

\[
\text{ADC}_{\text{PP}} = \text{average daily consumption from the previous Meter Reading period.}
\]

5.3.3. Type 63 - Customer Class Method

To perform a type 63 Substitution, the MDP must provide a Substitution or Estimation by calculating the energy consumption as per the following formula:

\[
\text{Energy Consumption} = \text{ADC}_{\text{CC}} \times \text{number of days required}
\]

where

\[
\text{ADC}_{\text{CC}} = \text{average daily consumption for this End User class with the same type of usage.}
\]

5.3.4. Type 64 - Agreed Method

To perform a type 64 Substitution, the MDP may undertake to use another method of Substitution (which may be a modification of an existing Substitution type), where none of the existing Substitution types are applicable, subject to using reasonable endeavours to form an agreement with the FRMP, LR and LNSP for the connection point. The specifics of this Substitution type may involve a globally applied method.

5.3.5. Type 65 - ADL Method

To perform a type 65 Substitution, the MDP must provide a Substitution or Estimation by calculating the energy consumption in accordance with the following formula:

\[
\text{Energy Consumption} = \text{ADL} \times \text{number of days required}
\]

5.3.6. Type 66 - Revision of Substituted Metering Data

To perform a type 66 Substitution, the MDP must re-Substitute or change substituted metering data prior to collecting an Actual Meter Reading or prior to the date referred to as R2 in the Data Delivery Calendar (whichever occurs first), where the FRMP, LR and LNSP for the connection point have agreed to revise the original substituted metering data, on the basis of Site or End User-specific information.
5.3.7. Type 67 - Customer Reading

Unless the MDP is required to apply a type 68 Substitution, the MDP must Substitute any previously substituted metering data or estimated metering data based directly on a Meter Reading provided by an End User.

5.3.8. Type 68 - Zero

The MDP must undertake Substitutions or Estimations of ‘zero’ where either the LNSP or MP has informed the MDP of a de-energised connection point or an inactive meter and where the consumption is known to be zero.

6. SUBSTITUTION AND ESTIMATION FOR CALCULATED METERING DATA

6.1. Substitution Rules

The MDP must:

(a) obtain clear and concise identification as to the cause of any missing or erroneous calculated metering data for which substituted metering data are required;

(b) ensure that all substituted metering data and estimated metering data are based on calculated metering data and not on any previous Substitutions or Estimations (as applicable);

(c) base calculated metering data for type 7 metering installations on Inventory Table data as follows:

(i) where the Inventory Table has not been updated for the period concerned, calculated metering data must be based on the most recent available information and provided as an Estimate; and

(ii) where the Inventory Table is correct for the period concerned, the calculated metering data must be flagged as ‘A’ metering data, however, when the Inventory Table is subsequently updated for the period concerned, the calculated metering data must be flagged as ‘F’ metering data;

(d) notify the LNSP, LR and FRMP for the connection point of any Substituted calculated metering data within two business days of the Substitution. Notification is achieved via the Participant metering data file as detailed within the service level procedures; and

(e) flag all calculated metering data Substitutions as ‘F’.

The MDP may apply the following Substitution and Estimations types:

(f) Substitutions: type 71, 72, 73, or 74.

(g) Estimations: type 75.

6.2. Substitution and Estimation Types

6.2.1. Type 71 - Recalculation

To perform a type 71 Substitution, the MDP must Substitute calculated metering data with the calculated metering data obtained by a recalculation based on the current Inventory Tables, Load Tables and On/Off Tables.

6.2.2. Type 72 - Revised Tables

Where the error in the calculated metering data is due to errors in the Inventory Table, Load Table or On/Off Table, the MDP must Substitute calculated metering data by a recalculation based on the most recent Inventory Tables, Load Tables and On/Off Tables in which there were no errors.

6.2.3. Type 73 - Revised Algorithm

Where the error in the calculated metering data is due to an error in its calculation the MDP must Substitute the most recent calculated metering data for which there was no error.
6.2.4. **Type 74 - Agreed Method**

The MDP may use another method of *calculated metering data* Substitution (which may be a modification of an existing Substitution type), where none of the existing Substitution types is applicable, subject to using reasonable endeavours to form an agreement between the FRMP, LR and LNSP for the *connection point*. The specifics of this Substitution type may involve a globally applied method.

6.2.5. **Type 75 - Existing Table**

The MDP must provide an Estimate for the *calculated metering data* based on the most recent Inventory Table until such time as an updated Inventory Table is received for the period concerned.

7. **GENERAL DATA VALIDATION REQUIREMENTS**

7.1. **Validation requirements for all metering installations**

MDPs must manage systems and processes on the basis that:

(a) stored *metering data* held in the *meter* buffer might be subject to installation measurement error;

(b) data delivered by reading systems, (e.g. remote reading systems, hand-held readers and conversion software) might not be recovered from the *meters* without corruption; and

(c) auditable Validation procedures are of critical importance and can have a direct impact on disputes. It is essential that MDPs comply with these Validation procedures and that all *metering data* is subject to Validation prior to delivery to AEMO and *Registered Participants*.

7.2. **Validation of Interval Metering Data Alarms**

(a) The MDP must Validate *interval metering data* against the following Meter Alarms when these are provided in the *meter*:

(i) power failure/meter loss of supply

(ii) VT or phase failure;

(iii) pulse overflow;

(iv) cyclic redundancy check error; and

(v) time tolerance.

(b) Where *interval metering installations* assign alarms to the data channel and the *interval metering data* concerned, the MDP must process the alarm along with the *metering data* as part of the required Validation.

(c) The MDP must ensure that all *metering data* alarm reports are signed off and dated by the person actioning the data exception report review as part of the Validation.

(d) The MDP must Validate all *interval metering data* with all *metering data* alarms prior to dispatch to AEMO or *Registered Participants*.

(e) All MDP exception reports must provide, for all instances where the *interval metering data* was found to be corrupted an indication of the subsequent actions undertaken by the MDP.

8. **VALIDATION WITHIN THE METER READING PROCESS**

8.1. **Validations during Collection of Metering Data from Manually Read Interval Metering Installations**

The Validations to be performed by MDPs responsible for the collection of *interval metering data* from manually read *metering installations* are as follows:

(a) The Meter Serial ID matches the recorded Meter Serial ID.

(b) The security of the *metering installation* is intact, e.g. *meter* seals in place and in good order.
8.2. Validations during collection of Accumulated Metering Data

The Validations to be performed by MDPs responsible for the collection of accumulated metering data are as follows:

(a) The value of metering data from the current Meter Reading ≥ the value of metering data from the previous Meter Reading.
(b) The value of metering data from the current Meter Reading is valid against an expected minimum value.
(c) The value of metering data from the current Meter Reading is valid against an expected maximum value.
(d) The Meter Serial ID matches the recorded Meter Serial ID.
(e) The security of the metering installation is intact, e.g. meter seals in place and in good order.
(f) The time synchronisation of the metering installation is correct to EST inclusive of any load control devices.
(g) The dial capacity is checked against the recorded dial capacity.

9. VALIDATION AS PART OF THE REGISTRATION PROCESS

9.1. Validation of Metering Installations – General Requirements

MDPs must confirm that the NMI is registered in MSATS after any installation or change to a metering installation prior to the distribution of any interval metering data to AEMO or Registered Participants for the purposes of settlements.

9.2. Validation of Metering Installations with Remote Acquisition of Metering Data

MDPs must carry out the following Validations after any installation or change to a metering installation with remote acquisition of metering data prior to the distribution of any interval metering data to AEMO or Registered Participants for the purposes of settlements:

(a) For instrument transformer connected metering installations, the metering installation is recording metering data correctly, in conjunction with the MP.
(b) For whole current metering installations, the metering data correctly pertains to the registered metering installation.
(c) All Datastreams are captured.

9.3. Validation for Manually Read Interval Metering Installations

The MDP must carry out the following Validations in conjunction with the MP for manually read interval metering installations after any changes to a metering installation prior to the distribution of any interval metering data to AEMO or Registered Participants for the purposes of settlements:

(a) The metering data correctly pertains to the registered metering installation.
(b) All Datastreams are captured.

9.4. Validation for Metering Installations with Accumulated Metering Data

MDPs must carry out the following Validations, following any changes to a metering installation and prior to the distribution of any accumulated metering data to AEMO or Registered Participants for the purposes of settlements:

(a) The metering data correctly pertains to the registered metering installation.
9.5. Validation for Metering Installations with Calculated Metering Data

MDPs must validate the calculated metering data on registration of all metering installations to verify that the Inventory Tables, Load Tables and On/Off Tables are complete and correct for the specifics of the metering installation.

10. VALIDATION OF METERING DATA

10.1. General

For connection points where AEMO is required to appoint an MDP to provide metering data services, AEMO may also request the MDP to perform Validations in addition to those specified in section 10 to further ensure the quality and completeness of the metering data.

For metering installations with remote acquisition installed in accordance with clause 7.8.9(b) of the NER, the MDP may perform Validation in accordance with sections 10.4 and 10.5, instead of section 10.2.

10.2. Validations for Metering Installations with Remote Acquisition of Metering Data

MDPs must, as a minimum, undertake the following Validations within the metering data services database for metering installation types with remote acquisition of metering data:

(a) A check of all interval metering data against a nominated maximum value.
   (i) This Validation is to ensure that erroneous interval metering data spikes are trapped and substituted.
   (ii) This check may additionally be performed in the polling software.

(b) A check of the maximum value of active energy and reactive energy.
   (i) For CT metering installations, the maximum value is to be initially determined by the connected CT ratio of the metering installation.
   (ii) For whole current metering installations the maximum rating of the meter is to be used.

(c) Check against a nominated minimum value or, alternatively, a ‘zero’ check that tests for an acceptable number of zero Intervals values per day to be derived from the Site’s Historical Data.

(d) Check for null (no values) metering data in the metering data services database for all Datastreams.
   (i) The aim of this check is to ensure that there is a 100% metering data set (and substitution for any missing interval metering data is undertaken).
   (ii) The minimum check required is to ensure that there is at least one non-null active energy or reactive energy value per Interval per Datastream.

(e) Check for the Meter Alarms referred to in section 7.2 and ensure:
   (i) a process is in place that captures these Meter Alarms within the Validation and ensures that any Meter Alarm occurrences are retained as part of the metering data audit trail; and
   (ii) provide details of the occurrences of Meter Alarms to relevant Registered Participants within the metering data file in accordance with the MDFF Specification.

10.3. Validations for Metering Installations with Check Metering or Partial Check Metering
MDPs must undertake the following Validations by comparing the metering data and check metering data for all metering installations that have associated check metering installations or partial check metering installations:

(a) For metering installations where the check metering installation duplicates the metering installation accuracy, the MDP must Validate the metering installation Datastreams and check metering Datastreams on a per Interval basis. The average of the two Validated metering data sets will be used to determine the energy measurement.

(b) For installations where the check metering data Validation requires a comparison based on nodal balance (comparing the sum energy flow to the busbar against energy flow from the busbar):

(i) The MDP must construct a Validation algorithm within the metering data services database that will facilitate comparison of interval metering data for each energy flow on a per Interval basis.

(ii) The MDP must conduct an analysis of the Historical Data for each connection point to ascertain whether error differences in nodal balance are acceptable.

(iii) The MDP should use this information to refine its Validation algorithms to minimise the error difference for each connection point, based on Historical Data.

(iv) The maximum error difference considered acceptable for any connection point is 1% on a per Interval basis. The MDP should minimise this for each connection point, based on Historical Data.

(c) Where the check metering installation is remote from the metering installation (e.g. at the other end of a transmission line or the other side of a transformer):

(i) The MDP must construct a Validation algorithm within the metering data services database that will facilitate comparison of interval metering data from the metering installation and the check metering installation on a per Interval basis with adjustment for respective transformer or transmission line losses.

(ii) The MDP must conduct an analysis of the Historical Data for each connection point to ascertain whether the error differences between the metering data from the metering installation and check metering installation are acceptable.

(iii) The MDP should use this information to refine its Validation algorithms to minimise the error difference for each connection point, based on Historical Data.

(iv) The maximum error difference considered acceptable for any connection point is 5% on a per Interval basis. The MDP should minimise this for each connection point, based on Historical Data.

(d) For connection points where SCADA data is made available by AEMO for the purposes of Validation, the MDP must Validate the metering data by comparison of the interval metering data against the SCADA data as provided by AEMO in the agreed format:

(i) The MDP must construct a Validation algorithm within the metering data services database that will facilitate comparison of interval metering data from the metering installation and the SCADA data on a per Interval basis.

(ii) The MDP must conduct an analysis of the Historical Data for each connection point to ascertain whether error differences between the interval metering data from the metering installation and the SCADA data are acceptable.

(iii) The MDP should use this information to refine its Validation algorithms to minimise the error difference for each connection point, based on Historical Data.

(iv) The MDP must construct an appropriate Validation algorithm as the SCADA data may be derived from a different measurement point, have a different interval collection period or have a different base unit of measurement, (e.g. power not energy value) with allowances for a larger error of measurement.
(v) The MDP is only required to undertake Validation of metering data against the SCADA data on the primary data channel i.e. only ‘B’ channel Validation where the FRMP is either a Generator or MSGA and only ‘E’ channel Validation for loads, such as pumps.

10.4. Validations for Manually Read Interval Metering Installations with CTs

MDPs must, as a minimum, undertake the following Validations on metering data from manually read interval metering installation with CTs within the metering data services database:

(a) Check of all interval metering data against a nominated maximum value.
   (i) This Validation is to ensure that erroneous interval metering data spikes are trapped and Substituted.
   (ii) This check may additionally be performed in the collection software.

(b) A check of the maximum value of active energy, which must initially be determined by the connected CT ratio of the metering installation (maximum reactive energy checks may also be performed as an option).

(c) Check against a nominated minimum value or, alternatively, a ‘zero’ check that tests for an acceptable number of zero Interval values per day to be derived from the Site’s Historical Data.

(d) Check for null (no values) metering data in the metering data services database for all Datastreams.
   (i) The aim of this check is to ensure that there is a 100% metering data set (and Substitution for any missing interval metering data is undertaken).
   (ii) The minimum check required is to ensure that there is at least one non-null active energy or reactive energy value per Interval per Datastream.

(e) Check for Meter Alarms referred to in section 7.2 and ensure:
   (i) a process is in place that captures these Meter Alarms within the Validation and ensures that any Meter Alarm occurrences are retained as part of the metering data audit trail; and
   (ii) the relevant Registered Participants are notified of the occurrences of these Meter Alarms within the metering data file in MDFF.

(f) Where supported by the meter(s), Validation for a given period of interval metering data by comparison of the totalised interval energy data (accumulation register reading) and the change in the meter cumulative registers (energy tolerance). It is acknowledged that this check would not identify CT ratio changes that have occurred after initial commissioning and have not been advised to the MDP.

(g) A check of the metering data for continuity and reasonability over the meter reading period.
   (i) Check that no gaps in the metering data exist.
   (ii) Check that metering data for the expected period has been delivered based on the Scheduled Meter Reading date.

10.5. Validations for Whole Current Manually Read Interval Metering Installations

MDPs must, as a minimum, undertake the following Validations on metering data from whole current manually read interval metering installations within the metering data services database:

(a) Check of all interval metering data against a nominated maximum value.
   (i) This Validation is to ensure that erroneous interval metering data spikes are trapped and Substituted.
   (ii) This check may additionally be performed in the collection software.

(b) A check of maximum value of active energy. (Maximum reactive energy checks may also be performed as an option). The maximum value is to be initially set to the rating of the meter.
(c) Check for null (no values) metering data in the metering data services database for all Datastreams.

(i) The aim of this check is to ensure that there is a 100% metering data set (and Substitution for any missing metering data is undertaken).

(ii) The minimum check required is to ensure that there is at least one non-null active energy or reactive energy value per Interval per Datastream.

(d) Check for the Meter Alarms referred to in section 7.2. The MDP is not required to Validate the interval metering data for power outage or power failure alarms, but must ensure:

(i) a process is in place that captures these Meter Alarms within the Validation and ensures that any Meter Alarm occurrences are retained as part of the metering data audit trail; and

(ii) the relevant Registered Participants are notified of the occurrences of Meter Alarms within the metering data file in accordance with the MDFF Specification.

(e) Where supported by the meter(s). Validation for a given period of interval metering data by comparison of the totalised interval energy data values (accumulation register reading) and the change in the meter cumulative registers (energy tolerance).

(f) A check of the metering data for continuity and reasonability over the meter reading period.

(i) Check that no gaps in the metering data exist.

(ii) Check that metering data for the expected period has been delivered based on the expected reading date.

10.6. Validations for Metering Installations with Accumulated Metering Data

MDPs must undertake the following Validations within the metering data services database for metering installations with accumulated metering data:

(a) Check against a nominated minimum value of metering data collected from the metering installation.

(b) Check against a nominated maximum value of metering data collected from the metering installation. This is to be applied to both the metering data collected from the metering installation and the calculated energy consumption values.

(c) The current value of metering data collected from the metering installation ≥ previous value of metering data collected from the metering installation.

(d) The current value of metering data collected from the metering installation is numeric and ≥ 0.

(e) The current date that metering data is collected from the metering installation > the previous date that metering data was collected from the metering installation.

(f) Check for null (no values) metering data in the metering data services database for all Datastreams. The aim of this check is to ensure that there is a 100% metering data set and Substitution for any missing metering data is undertaken.

10.7. Validations for Metering Installations with Calculated Metering Data

MDPs must undertake the following Validations of calculated metering data within the metering data services database:

(a) Check against a nominated maximum calculated metering data value.

(b) Calculated metering data value is numeric and ≥ 0.

(c) Check for null (no values) calculated metering data for all Datastreams. The aim of this check is to ensure that there is a 100% calculated metering data set (and Substitution for any missing calculated metering data has been undertaken).

(d) Check the Inventory Tables, Load Tables and On/Off Tables using a process approved by the MC to ensure that the correct version of these tables is being used for the production of calculated metering data.
(e) Check against a nominated minimum value, or alternatively, a ‘zero’ check that tests for an acceptable number of zero interval values per day.

(f) Calculated metering data date > previous calculated metering data date.

11. LOAD PROFILING – CONVERSION OF ACCUMULATED METERING DATA

11.1. Requirements for Load Profiling

Load Profiling is required to determine interval metering data, for settlements for type 6 metering installations. The requirements vary from Jurisdiction to Jurisdiction.

11.1.1 Victoria, ACT and Tasmania

The requirements for Load Profiling in Victoria, ACT, and Tasmania are to:

(a) determine an estimate of the average Load Profile for a Profile Area over a given period of time (Profile Preparation Service); and

(b) allocate that Load Profile to End Users in that Profile Area (Basic Meter Profiler).

11.1.2 NSW and Queensland

The requirements for Load Profiling in NSW and Queensland are to:

(a) determine an estimate of the average Load Profile for First-Tier Controlled Loads and Second-Tier Controlled Loads for a Profile Area over a given period of time (Profile Preparation Service – Controlled Load Profile);

(b) allocate that profile to both first-tier and second-tier Controlled Loads metering data (Basic Meter Profiler – Controlled Load Profile);

(c) determine an estimate of the average Load Profile of the remaining first-tier loads and second-tier loads for a Profile Area (that is, excluding the first-tier and second-tier Controlled Loads) over a given period of time (Profile Preparation Service – Net System Load Profile); and

(d) allocate that Load Profile to second-tier non-Controlled Loads in that Profile Area (Basic Meter Profiler – Net System Load Profile).

11.1.3 South Australia

The requirements for Load Profiling in South Australia are to:

(a) determine an estimate of the average Load Profile for first-tier and second-tier Controlled Loads for a Profile Area over a given period of time (Profile Preparation Service – Controlled Load Profile);

(b) allocate that profile to second-tier Controlled Loads in that Profile Area (Basic Meter Profiler – Controlled Load Profile);

(c) determine an estimate of the average Load Profile of the remaining first-tier loads and second-tier loads for a Profile Area (that is, excluding the first-tier and second-tier Controlled Loads) over a given period of time (Profile Preparation Service – Net System Load Profile); and

(d) allocate that Load Profile to second-tier non-Controlled Loads in that Profile Area (Basic Meter Profiler – Net System Load Profile).

11.2. Profile Preparation Service - Controlled Load Profile

11.2.1. NSW

Profile Preparation Service - Controlled Load is applied in NSW as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, CLPs for each Profile Area must be prepared by AEMO using interval metering data from a samples of Controlled Load interval meters in accordance with section 11.3.3 and paragraphs (b) and (c).
(b) The sample meters to be installed by the LNSPs must provide remote acquisition of interval metering data.

(c) Two NMIs must be allocated to each sample meter.
   (i) One NMI must be used for the interval metering data from the sample meter that is used to prepare the CLP; and
   (ii) Where the metering installation has a sample meter and the FRMP for the market load in MSATS is not the LR a second NMI must be used to transfer the accumulated metering data to which the CLP is applied.

(d) The requirements for one CLP are:
   (i) There shall be at least one CLP in each Profile Area.
   (ii) An LNSP may introduce a second CLP in its Profile Area.
   (iii) If the LNSP does not introduce a second CLP, one CLP must be calculated for all Controlled Loads in a Profile Area, which is based on a sample of Controlled Load Interval Meters.
   (iv) For each TI, the CLP must be calculated by Profile Area as follows:

\[
\text{CLP for a Profile Area for TI}_j = \sum_{n=1}^{N} \text{(sample meter load in TI}_j)_n * (\text{wf})_n
\]

where:
- \( N \) represents the set of sample NMIs in the Profile Area
- \( \text{wf} \) is the weighting factor associated with the NMIs.

(e) The requirements for two CLPs are:
   (i) if the LNSP introduces a second CLP, it must notify the commencement date of the second CLP in writing to AEMO and all retailers;
   (ii) the commencement date must be at least six months after the date of the notice; and
   (iii) from the commencement date, CLPs must be calculated for each Profile Area.

(f) For each TI, the CLPs must be calculated by Profile Area as follows:
   (i) CLP for loads on the Controlled Load 1 network tariff

\[
= \sum_{n=1}^{N} (\text{load for sample meter on the controlled load 1 network tariff in trading interval } j)_n * (\text{wf})_n
\]

where:
- \( N \) represents the set of sample NMIs on the Controlled Load 1 Network Tariff in the Profile Area.
- \( \text{wf} \) = weighting factor associated with the NMIs.

(ii) CLP for loads on the Controlled Load 2 network tariff

\[
= \sum_{m=1}^{M} (\text{load for sample meter on the controlled load 2 network tariff in trading interval } j)_m * (\text{wf})_m
\]

where:
- \( M \) represents the set of sample NMIs on the Controlled Load 2 network tariff in the Profile Area.
- \( \text{wf} \) = weighting factor associated with the NMIs.

11.2.2. Queensland

Profile Preparation Service - Controlled Load is applied in Queensland, except in Ergon Energy’s distribution area, as follows:
(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, CLPs for the Profile Area must be prepared by AEMO using *interval metering data* from a sample (or samples) of Controlled Load Interval Meters in accordance with section 11.3.3 and paragraphs (b) and (c).

(b) The sample *meters* to be installed by the LNSP must be type 4 *metering installations*.

(c) Two NMIs may need to be allocated to each sample *meter*:
   
   (i) one NMI must be used for the *interval metering data* from the sample *meter* that is used to prepare the CLP; and
   
   (ii) where the *metering installation* that has a sample *meter* is second-tier, a second NMI must be used to transfer the *accumulated metering data* to which the CLP is applied.

(d) Two CLPs must be calculated for the Profile Area:
   
   (i) one for Controlled Loads in the Profile Area based on a sample of Controlled Load Interval Meters on the Controlled Load 1 network tariff; and
   
   (ii) one for Controlled Loads in the Profile Area based on a sample of Controlled Load Interval Meters on the Controlled Load 2 network tariff.

(e) For each TI, the CLPs must be calculated by Profile Area as follows:
   
   (i) **CLP for loads** on the Controlled Load 1 network tariff
       
       \[
       \sum_{n=1}^{N} \left( \text{load for sample meter on the controlled load 1 network tariff in trading interval } j \right) \times (wf)_n
       \]
       
       where:
       
       \( N \) = represents the set of sample NMIs on the Controlled Load 1 network tariff in the Profile Area.
       
       \( wf \) = weighting factor associated with the NMIs.

   (ii) **CLP for loads** on the controlled load 2 network tariff
       
       \[
       \sum_{m=1}^{M} \left( \text{load for sample meter on the controlled load 2 network tariff in trading interval } j \right) \times (wf)_m
       \]
       
       where:
       
       \( M \) = represents the set of sample NMIs on the Controlled Load 2 network tariff in the Profile Area.
       
       \( wf \) = weighting factor associated with the NMIs.

### 11.2.3. South Australia

Profile Preparation Service - Controlled Load is applied in South Australia as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, a single CLP for all Controlled Loads for each Profile Area must be prepared by AEMO using *interval metering data* from a sample of Controlled Load Interval Meters in accordance with section 11.3.3 and paragraphs (b) and (c).

(b) The sample *meters* to be installed by the LNSP must be a type 4 *metering installation*.

(c) Two NMIs may need to be allocated to each sample *meter*:
   
   (i) one NMI must be used for the *interval metering data* from the sample *meter* that is used to prepare the CLP; and
   
   (ii) where the *metering installation* that has a sample *meter* is second-tier, a second NMI must be used to transfer the *accumulated metering data* to which the CLP is applied.

(d) For each TI, the CLP must be calculated by Profile Area as follows:

   **CLP for a profile area for a TI**
   
   \[
   \sum_{i=1}^{N} (\text{sample meter load in } TI_j) \times (wf)_n
   \]
where:
N = represents the set of sample NMI in the Profile Area
wf = is the weighting factor associated with the NMI.

11.3. Accumulation Meter Profiler – Controlled Load

11.3.1. NSW & Queensland

Basic Meter Profiler - Controlled Load is applied in NSW & Queensland as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, AEMO must apply the appropriate CLP for the Profile Area to which the NMI is connected, to the accumulated metering data for all first-tier and second-tier Controlled Loads in order to obtain interval metering data.

(b) The requirements for one CLP are:
   (i) For NMIs in a Profile Area with one CLP, the CLP must be applied as follows:
   \[ \text{Half hourly metering data for } T_{ij} \text{ for a NMI Datastream} = \frac{\sum_{i=\text{startdate}}^{\text{enddate}} \text{CLP}_i}{\text{CLP}_j} \]
   where:
   \( \text{CLP}_j \) = the calculated CLP energy for \( T_{ij} \)
   \[ \sum_{i=\text{startdate}}^{\text{enddate}} \text{CLP}_i \] = the sum of CLP energy between the start date and the end date
   and;
   ‘start date’ and ‘end date’ are defined in Section 11.6.

(c) The requirements for two CLPs are:
   (i) In a Profile Area where the LNSP has introduced a second CLP, the CLPs shall be applied as follows:
   Loads on the Controlled Load 1 network tariff (CLP1) must be applied to the accumulated metering data for all first tier and second-tier Controlled Loads, which are on the Controlled Load 1 network tariff:

   Interval metering data for \( T_{ij} \) for a NMI Datastream on the Controlled Load 1 network tariff
   \[ = \frac{\sum_{i=\text{startdate}}^{\text{enddate}} \text{CLP1}_i}{\text{CLP1}_j} \]
   where:
   \( \text{CLP1}_j \) = the calculated CLP energy for \( T_{ij} \)
   \[ \sum_{i=\text{startdate}}^{\text{enddate}} \text{CLP1}_i \] = the sum of CLP energy between the start date and the end date
   and;
   ‘start date’ and ‘end date’ are defined in Section 11.6.

   Loads on the Controlled Load 2 network tariff (CLP2) must be applied to the accumulated metering data for all first-tier and second-tier Controlled Loads, which are on the Controlled Load 2 network tariff:

   Interval metering data for \( T_{ij} \) for a NMI Datastream on the Controlled Load 2 network tariff
\[
\text{CLP}_j = \left(\text{Accumulation energy data between start date and end date}\right) \times \left(\text{CLP}_j\right)
\]

where:

\[
\sum_{i=\text{start date}}^{\text{enddate}} \text{CLP}_i = \text{the sum of CLP energy between the start date and the end date}
\]

and;

‘start date’ and ‘end date’ are defined in Section 11.6.

(d) The resulting interval metering data produced by applying the CLP is at the NMI Datastream level. The total of these Datastreams is used in the calculation of the Net System Load Profile.

11.3.2. South Australia

Basic Meter Profiler - Controlled Load is applied in South Australia as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, AEMO must apply the CLP for the Profile Area to which the NMI is connected, to the accumulated metering data for all first-tier and second-tier Controlled Loads, in order to obtain interval metering data.

(b) The accumulated metering data for first-tier loads is represented by a weekly load scaling factor that is transferred to AEMO in accordance with section 5.9.4 of Metrology Procedure: Part A.

(c) The profile must be applied as follows:

(i) Interval metering data for TIj for a NMI Datastream

\[
\text{CLP}_j = \left(\text{Accumulation energy data between start date and end date}\right) \times \left(\text{CLP}_j\right)
\]

where:

\[
\sum_{i=\text{start date}}^{\text{enddate}} \text{CLP}_i = \text{the sum of CLP energy between the start date and the end date}
\]

and;

‘start date’ and ‘end date’ are defined in Section 11.6.

(ii) If the accumulated metering data is based on an Actual Meter Reading:

(A) Start date = 00:00 on the day of the previous Meter Reading.

(B) End date = the end of the TI commencing at 23:30 on the day prior to the current Meter Reading date.

(iii) If the accumulated metering data is Estimated:

(A) Start date = 00:00 on the first day of the billing period, or 00:00 on the previous Meter Reading date (whether actual or Estimate), or 00:00 on the first day that the load becomes second-tier, whichever is the later.

(B) End date = the end of the TI commencing at 23:30 on the last day of the billing period, or the end of the TI commencing at 23:30 on the Estimated Meter Reading date, whichever is the earlier.

(iv) The resulting interval metering data produced by applying the CLP is at the NMI Datastream level. The total of these Datastreams is used in the calculation of the NSLP.
11.3.3. Sample Meters

(a) Where metering equipment to sample Controlled Loads is installed, the MC must ensure that:
   (i) at least 200 Controlled Load sample meters are installed for the purposes of calculating each CLP within a profile area unless otherwise agreed by AEMO; and
   (ii) the method it adopts for selecting sample meters is statistically sound.

(b) This paragraph (b) only applies to South Australia.
   (i) The LNSP must ensure that at least 200 Controlled Load sample meters are installed for the purposes of calculating the CLP.
   (ii) The method of selecting sample meters adopted by the LNSP must be approved by AEMO.
   (iii) The LNSP must use reasonable endeavours to ensure that sample meters:
         (A) are used at occupied Sites;
         (B) have historical annual energy consumption with a lower range exceeding 1,000kWh and an upper range not exceeding two standard deviations of the mean Controlled Load annual consumption;
         (C) subject to sub-paragraph (D), must be randomly selected such that each meter that meets the other criteria has an equal chance of being included in the sample; and
         (D) new sample meters are selected to maintain a sample distribution that is representative of the Controlled Load in accordance with section 11.3.3(b)(ii).
   (iv) If an existing sample meter becomes inappropriate for a sample meter, the sample meter must be removed or relocated to an appropriate Site selected in accordance with section 11.3.3(b)(iii).
   (v) The LNSP must ensure that a meter which is a sample Interval Meter installed for the purposes of calculating the CLP is not removed without the consent of AEMO.

(c) The weighting factor assigned to each sample meter NMI in the calculation of the CLP should be proportional to \(1/n\), where \(n\) is the number of sample meters contributing to the calculation of the CLP in the respective LNSP area.

\[
\text{Weighting Factor} = \frac{(sf) \times (dlf)}{n}
\]

where:

- \(sf\) = scaling factor (for South Australia = 200)
- \(dlf\) = distribution loss factor applicable to the sample meter
- \(n\) = number of sample meters used in the calculation of the CLP

(d) Paragraph (d) only applies to South Australia.
   (i) AEMO must approve the calculation of the load scaling factor for the CLP at least once every six months.
   (ii) For each week, the LNSP must calculate the load scaling factor as follows:

\[
\text{(Weekly Load Scaling Factor)} = X \times \frac{(Weekly\,Sample\,Energy) \times (Annual\,CL\,Energy)}{(Annual\,Sample\,Meter\,CL\,Energy)}
\]

where:

Weekly Load Scaling Factor (MWh) = a value calculated to be the total energy consumed for a one week period by Accumulation Metered Controlled Loads that are first-tier loads.
X = the estimated proportion of Accumulation Metered Controlled Loads that are first tier loads determined for the six month period beginning 1 July and 1 January respectively.

Annual CL Energy (MWh) = the annual Controlled Load energy of all End Users for the whole calendar year preceding the regulatory year t.

Annual Sample Meter CL Energy (MWh) = total annual sample meter Controlled Load energy for the whole calendar preceding regulatory year t.

Weekly Sample Energy (MWh) = the value representing the actual energy consumption recorded by the sample meters in a one week period.

(iii) The LNSP must send the load scaling factor to AEMO as an active first-tier load accumulation metered Datastream, with the Actual Meter Read Date as the last day in the settlement week, at a frequency which is at least once per week.

11.4. Profile Preparation Service - Net System Load Profile

Profile Preparation Service – Net System Load Profile is to be applied as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, the form of profiling that AEMO must use for the metering installations to which the metrology procedure applies, excluding metering installations for Controlled Loads where applicable to a Jurisdiction, is the NSLP.

(b) The NSLP must be calculated by Profile Area as follows:

\[
NSLP = \sum_{i=1}^{l} \left( \text{Energy inflow to the profile area at the TNI level} \right)_i * MLF_i
+ \sum_{m=1}^{n} \left( \text{Energy generated within profile area from embedded generation} \right)_m * MLF_m * DLF_m
- \sum_{s=1}^{t} \left( \text{Half hourly load in profile area} \right)_s * MLF_s * DLF_s
\]

where

MLF = marginal loss factor applicable for the NMI that is stored in MSATS

DLF = distribution loss factor applicable for the NMI that is stored in MSATS

i = Each TNI with energy inflows to Profile Area

m = Each energy generated by embedded generating units within Profile Area

s = Half hourly loads in Profile Area except interval metering data in respect of loads at child connection points in an embedded network.

11.5. Accumulation Meter Profiler - Net System Load Profile

Accumulation Meter Profiler – Net System Load Profile is to be applied as follows:

(a) In accordance with section 5.9.2 of Metrology Procedure: Part A, AEMO must apply the NSLP for the Profile Area to which the NMI is connected, to the metering data for type 6 metering installations in order to obtain interval metering data.

(b) The profile must be applied as follows:

\[
\text{Interval metering data for T}i \text{ for NMI Datastream} = \frac{\text{(Accumulation energy data between start date and end date) * NSLP}_i}{\sum_{i=\text{start date}}^{\text{end date}} NSLP_i}
\]

(i) where the accumulated metering data is based on an Actual Meter Reading,
start date = 00:00 on the day of the previous meter reading, and
end date = the end of the TI commencing at 23:30 on the day prior to the current meter reading date; or

(ii) where the accumulated metering data is an Estimate:
    start date = 00:00 on the first day of the billing period, or 00:00 on the day of the previous meter reading date (whether actual or Estimate), or 00:00 on the first day that the load becomes a second-tier load, whichever is the later; and
    end date = the end of the TI commencing at 23:30 on the last day of the billing period, or the end of the TI commencing at 23:30 on the Estimate meter reading date, whichever is the earlier.

(c) The resulting interval metering data produced by applying the NSLP is at the NMI Datastream level.

11.6. Start Dates and End Dates

(a) If the accumulated metering data is based on a Meter Reading:
    (i) the start date is 00.00 on the day of the previous Meter Reading; and
    (ii) the end date is the end of the TI commencing at 23.30 on the day prior to the current Meter Reading date; and

(b) if the accumulated metering data is based on an Estimate where the estimated metering data ends on a date in the future:
    (i) the start date is the later of:
        (A) 00.00 on the first day of the billing period related to the profile period; and
        (B) 00.00 on the previous Meter Reading date (i.e. the start of the estimated metering data period).
    (ii) the end date is the end of the TI commencing at 23.30 on the last day of the billing period related to the profile period.

12. UNMETERED LOADS – DETERMINATION OF METERING DATA

12.1. Requirement to produce Calculated Metering Data

12.1.1. Market Loads

(a) In accordance with clauses S7.3 and S7.4 of the NER, trading interval data is required to be calculated by NMI Datastream for those loads with type 7 metering installations.

(b) AEMO will publish a list of the loads that are classified as market loads and will keep this list up to date.

(c) If there is a Load Table, an Inventory Table or an On/Off Table, a type 7 metering installation may be classified as a market load.

12.1.2. Unmetered Devices

(a) A market load can result from the operation of an Unmetered Device. The only market loads in the NEM where Unmetered Devices are being used are:
    (i) street lights; and
    (ii) traffic lights in NSW and SA.

(b) There are two types of Unmetered Devices: Controlled Unmetered Devices and Uncontrolled Unmetered Devices.

(c) For each market load there may be one or more Unmetered Device types that are listed in the Load Table.
12.1.3. Application of NMI

(a) Metering data for an unmetered load is calculated by NMI Datastream. A NMI is assigned for each unique combination of:

(i) FRMP;
(ii) End User;
(iii) LNSP;
(iv) TNI; and
(v) DLF.

(b) An unmetered load NMI may contain different market loads or different Unmetered Device types, but they must have the same FRMP, End User, LNSP, TNI and distribution loss factor.

12.1.4. Load Table

(a) The Load Table must set out:

(i) for each Controlled Unmetered Device, its load (which includes any associated control gear, in watts) for use in calculating interval metering data in accordance with section 12.2; and

(ii) for each Uncontrolled Unmetered Device, its annual energy consumption in accordance with section 12.3. The annual energy consumption is used to calculate the calculated device wattage (in watts) which is used to calculate the interval metering data for each device type as follows:

\[
\text{(Calculated device wattage)} = \frac{\text{(device annual energy consumption)}}{365 \times 24}
\]

Where \( i \) = Uncontrolled Unmetered Device type \( i \).

(b) AEMO must maintain Load Tables by:

(i) deleting redundant data;

(ii) considering (including by taking into account the views of other interested parties) and publishing proposals from interested parties to add Unmetered Devices to a Load Table; and

(iii) publish updated Load Tables.

(c) No Registered Participant may use an Unmetered Device as a market load for which there is no load data in a Load Table.

(d) Proposals to add a new Unmetered Device load to the Load Table must include load measurement tests conducted by a NATA accredited laboratory or an overseas equivalent.

(e) Agreement for an Unmetered Device load to be added to the Load Table does not replace any obligation for an interested party to obtain appropriate approvals related to the performance and acceptance of use of the Unmetered Device.

12.2. Controlled Unmetered Devices

12.2.1. Metering Data Calculation

The MC must ensure that the interval metering data for Controlled Unmetered Devices classified as a type 7 metering installation are calculated in accordance with the following algorithm:

\[
\text{Interval metering data for Tj for NMI (in watt hours)} = \sum_{k} (\text{Device wattage}) \times (\text{Device count for NMI}) \times (\text{Period load is switched on}) \times (\text{Trading interval})
\]

where:
\[ i = \text{Unmetered Device type} \]
\[ j = T_{I} \]
\[ k = \text{proportion of Unmetered Device attributable to that NMI} \]

\( T_{I} \) is in minutes

Unmetered Device wattage/Device wattage is determined from the Load Table.
Unmetered Device count/Device count is determined from the Inventory Table.
Period load is switched on is determined from the On/Off Table.

12.2.2. Inventory Table

(a) For each NMI, a separate Inventory Table is required that identifies each Unmetered Device type that forms part of the load and for each Unmetered Device type lists:
   (i) the Unmetered Device type;
   (ii) the form of on/off control – photoelectric cell control, timer control, ripple control or other control;
   (iii) if timer control or ripple control, the on/off times for the timer control or the ripple control system;
   (iv) if other control, the on/off times;
   (v) if an Unmetered Device is shared with another NMI, the proportion of load that is agreed by affected Registered Participants to be attributable to that NMI \( k \). Each \( k \) factor will be less than 1. The sum of the \( k \) factors for a shared Unmetered Device across each respective NMI must be equal to 1;
   (vi) if an Unmetered Device is not shared with another NMI, the \( k \) factor must be equal to 1;
   (vii) number of such Unmetered Devices installed;
   (viii) effective start date – the first day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI;
   (ix) effective end date – the last day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI; and
   (x) last change date – the date that record in the Inventory Table was most recently created or modified.

(b) Each Unmetered Device in the Inventory Table is a unique combination of physical hardware, time control classification and shared portion. For example, if an Unmetered Device is shared with another NMI, the individual portions of the Unmetered Device(s) must be included in the Inventory Table as a separate Unmetered Device type on each NMI.

(c) Each MC must develop the initial Inventory Table for the NMI for which it is responsible. The initial Inventory Table must be agreed by each affected Registered Participant, AEMO and the relevant End User.

(d) Each MC must update the Inventory Table for the NMI for which it is responsible on at least a monthly basis to ensure that the accuracy requirements in section 13.5 of Metrology Procedure: Part A are met. Any changes to the Inventory Table may only be made on a retrospective basis where:
   (i) agreed by the MC and the affected Registered Participants; or
   (ii) necessary to comply with clause 7.9.4 of the NER.

(e) The MC must communicate any material changes to the Inventory Table to the affected Registered Participants.

(f) The MC must provide the Inventory Table to relevant Registered Participants when requested.

12.2.3. On/Off Table
The form of on/off control may be:

(a) photoelectric cell control;
(b) timer control, or ripple control; or
(c) other control.

### 12.2.4. Photoelectric cell control

(a) If the on/off times for an Unmetered Device are controlled by a photoelectric cell:

(i) On time = sunset time + ON delay.
(ii) Off time = sunrise time + OFF delay.

The ON delay and OFF delay are set out in section 12.4.

(b) The MC must ensure that the appropriate sunset times and sunrise times are obtained from the Australian Government Geoscience website ([www.ga.gov.au/geodesy/astro/sunrise.jsp](http://www.ga.gov.au/geodesy/astro/sunrise.jsp)), based on the longitude and latitude of the relevant town as specified below:

(c) The MC must ensure that the period that the load is switched on during a TI is calculated as follows:

<table>
<thead>
<tr>
<th>Trading interval</th>
<th>Period load is switched on</th>
</tr>
</thead>
<tbody>
<tr>
<td>For the TIs commencing after sunset and finishing prior to sunrise</td>
<td>Period load is switched on = 1</td>
</tr>
<tr>
<td>For the TIs commencing after sunrise and finishing prior to sunset</td>
<td>Period load is switched on = 0</td>
</tr>
</tbody>
</table>
12.2.5. Timer Control

(a) If the on/off times for an Unmetered Device is controlled by a timer or ripple injection system:
   
   (i) On time = ON time set on timer or ripple injection system.
   
   (ii) Off time = OFF time set on timer or ripple injection system.

(b) The MC must ensure that the period that the load is switched on during a TI is calculated as follows:

<table>
<thead>
<tr>
<th>Trading interval</th>
<th>Period load is switched on</th>
</tr>
</thead>
<tbody>
<tr>
<td>For the TIs commencing after on time and finishing prior to off time</td>
<td>Period load is switched on = 1</td>

</tr>
<tr>
<td>For the TI during which the on time occurs</td>
<td>( \frac{(\text{Period load is switched on})}{30} = \frac{(\text{End time of TI}) - (\text{On time})}{30} )</td>
</tr>
<tr>
<td>For the TI during which the off time occurs</td>
<td>( \frac{(\text{Period load is switched on})}{30} = \frac{(\text{Off time}) - (\text{Start time of TI})}{30} )</td>
</tr>
</tbody>
</table>

12.2.6. Other control

(a) Where the on/off times for an Unmetered Device are not in accordance with section 12.2.4 or 12.2.5, the following alternative forms of control may be used:

   (i) On time = sunset time + ON delay or ON time set on timer or ripple injection system.

   (ii) Off time = sunrise time + OFF delay or OFF time set on timer or ripple injection system or a fixed duration after ON time.

(b) Where sunrise or sunset times are used, the time is determined in accordance with section 12.2.4(b).

(c) The MC must ensure that the period that the load is switched on during a TI is calculated as follows:

<table>
<thead>
<tr>
<th>Trading interval</th>
<th>Period load is switched on</th>
</tr>
</thead>
<tbody>
<tr>
<td>For the TIs commencing after on time and finishing prior to off time</td>
<td>Period load is switched on = 1</td>
</tr>
<tr>
<td>For the TIs commencing after off time and finishing prior to on time</td>
<td>Period load is switched on = 0</td>
</tr>
<tr>
<td>For the TI during which the on time occurs</td>
<td>( \frac{(\text{Period load is switched on})}{30} = \frac{(\text{End time of TI}) - (\text{On time})}{30} )</td>
</tr>
<tr>
<td>For the TI during which the off time occurs</td>
<td>( \frac{(\text{Period load is switched on})}{30} = \frac{(\text{Off time}) - (\text{Start time of TI})}{30} )</td>
</tr>
</tbody>
</table>

12.3. Uncontrolled Unmetered Devices

Other unmetered loads do not have a constant load and, therefore, the energy calculation is based on an annual energy consumption determined by AEMO in accordance with section 12.1.4.
12.3.1. Energy calculation

The MC must ensure that the interval metering data for other Uncontrolled Unmetered Devices classified as a type 7 metering installation is calculated in accordance with the following algorithm:

\[
\text{Interval metering data for } T_l \text{ for } NMI \text{ (in watt hours)} = \frac{\sum_{i=1}^{n} (k) \times \text{Device wattage}_i \times \text{Device count for NMI}_i \times \text{Period load switched on}_i \times (T_l)}{60}
\]

where:
- \( i \) = Unmetered Device type
- \( j \) = TI
- \( k \) = proportion of Unmetered Device attributable to that NMI
- TI is in minutes

Unmetered Device wattage/Device wattage is determined from the Load Table.
Unmetered Device count/Device count is determined from the Inventory Table.
Period load is switched on is determined from the On/Off Table.

12.3.2. Inventory Table

(a) For each NMI, a separate Inventory Table is required that identifies each Unmetered Device type that forms part of the NMI load and for each Unmetered Device type lists:
   (i) the Unmetered Device type;
   (ii) the form of on/off control (24 hours per day);
   (iii) if an Unmetered Device is shared with another NMI, the proportion of load that is agreed by affected Registered Participants to be attributable to that NMI (k). Each k factor will be less than 1. The sum of the k factors for a shared Unmetered Device across each respective NMI must be equal to 1;
   (iv) if an Unmetered Device is not shared with another NMI, the k factor must be equal to 1;
   (v) number of such Unmetered Devices installed;
   (vi) effective start date – the first day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI;
   (vii) effective end date – the last day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI; and
   (viii) last change date – the date that record in the Inventory Table was most recently created or modified.

(b) Each Unmetered Device in the Inventory Table is a unique combination of physical hardware, time control classification and shared portion. For example, if an Unmetered Device is shared with another NMI, the individual portions of the Unmetered Device(s) shall be included in the Inventory Table as a separate Unmetered Device type on each NMI.

(c) Each MC must develop the initial Inventory Table for the NMIs for which it is responsible. The initial Inventory Table must be agreed with the affected Registered Participants, AEMO and the relevant End User.

(d) Each MC must update the Inventory Table for the NMIs for which it is responsible on at least a monthly basis to ensure that the accuracy requirements in section 13.5 of Metrology Procedure: Part A are met. Any changes to the Inventory Table may only be made on a retrospective basis where:
   (i) agreed by the MC and the affected Registered Participants; or
   (ii) necessary to comply with clause 7.9.4 of the NER.
(e) The MC must communicate any material changes to the Inventory Table to the affected Registered Participants.

(f) The MC must provide the Inventory Table to relevant Registered Participants when requested.

12.3.3. On/Off Table

(a) Other unmetered loads are assumed to operate 24 hours per day.

(b) For each TI: Period load is switched on = 1.

12.4. ON delay and OFF delay

(a) In Victoria, New South Wales, Queensland, Tasmania and South Australia the ON delays and OFF delays are zero.

(b) In the Australian Capital Territory, the MC must use the ON delay and OFF delay for each day, as provided in the following tables, when determining the on time and off time of photoelectric cells in accordance with section 12.2.4.

12.5. Traffic signal dimming

Section 12.5 applies from 1 July 2015 where traffic signals are classified as a *market load*.

These loads have characteristics similar to Controlled Unmetered Devices as they have specifically defined periods that calculated metering data is based on full load values and dimmed load values. These loads also have characteristics similar to Uncontrolled Unmetered Devices as they do not have a constant load and calculated metering data is based on an annual energy consumption for the load.

12.5.1. Metering Data Calculation

The MC must ensure that the *interval metering data* for traffic signal unmetered loads classified as a type 7 *metering installation* and can be dimmed, is calculated in accordance with the following algorithm:

\[
\text{Interval metering data for full wattage} \times (\text{TI}_{ij} \text{ for } NMI) = \sum_{i=1}^{n} (k) \times \text{Unmetered Device full wattage}_{i} \times (\text{Unmetered Device count for NMI}_{i} \times (\text{Period full wattage switched on}_{j} \times (\text{TI}_{i})) + \sum_{i=1}^{n} (k) \times \text{Unmetered Device dimmed wattage}_{i} \times (\text{Unmetered Device count for NMI}_{i} \times (\text{Period dimmed wattage on}_{j} \times (\text{TI}_{i}))
\]

where;

\[i = \text{Unmetered Device type}\]
\[j = \text{TI}\]
\[k = \text{proportion of Unmetered Device attributable to that } NMI\]
\[\text{TI} \text{ is in minutes}\]

Unmetered Device full wattage is determined from the Load Table.

Unmetered Device dimmed wattage is determined from the Load Table.

Unmetered Device count is determined from the Inventory Table.

Period full wattage switched on is determined from On/Off Table.

Period dimmed wattage switched on is determined from On/Off Table.

12.5.2. Inventory Table

(a) For each *NMI*, a separate Inventory Table is required that identifies each Unmetered Device type that forms part of the *NMI load* and for each Unmetered Device type lists:

<table>

</table>
(i) the Unmetered Device type;
(ii) the form of on/off control – photoelectric cell control or timer control;
(iii) if photoelectric cell control, sunset and sunrise times;
(iv) if timer control, the on/off times for the timer control;
(v) if an Unmetered Device is shared with another NMI, the proportion of load that is agreed by affected Registered Participants to be attributable to that NMI (k). Each k factor will be less than 1. The sum of the k factors for a shared Unmetered Device across each respective NMI must be equal to 1;
(vi) number of such Unmetered Devices installed;
(vii) effective start date – the first day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI;
(viii) effective end date – the last day on which that record in the Inventory Table is to be included in the calculation of metering data for that NMI; and
(ix) last change date – the date that record in the Inventory Table was most recently created or modified.

(b) Each Unmetered Device in the Inventory Table is a unique combination of physical hardware, time control classification and shared portion, for example, if an Unmetered Device is shared with another NMI, the individual portions of the Unmetered Device(s) must be included in the Inventory Table as a separate Unmetered Device type.

(c) Each MC must develop the initial Inventory Table for the NMI for which it is responsible. The initial Inventory Table must be agreed by the affected Registered Participants, AEMO and the relevant End User.

(d) Each MC must use reasonable endeavours to update the Inventory Table, for the NMIs for which it is responsible, on at least a monthly basis to ensure that the accuracy requirements in section 13.5 of Metrology Procedure: Part A are met. Such changes to the Inventory Table may only be made on a retrospective basis where:

(i) agreed by the MC and the affected Registered Participants; or
(ii) necessary to comply with clause 7.9.4 of the NER.

(e) The MC must communicate any material changes to the Inventory Table to the affected Registered Participants.

(f) The MC must provide the Inventory Table to relevant Registered Participants when requested.

12.5.3. On/Off Table
The form of on/off control may be:

(a) Photoelectric cell control; or
(b) Timer control.

12.5.4. Photoelectric cell control

(a) If the on/off times for the dimming operation is controlled by a photoelectric cell:

(i) Dimming on time = sunset time.
(ii) Dimming off time = sunrise time.

(b) The MC must ensure that the appropriate sunset times and sunrise times are obtained from the Australian Government Geoscience website (www.ga.gov.au/geodesy/astro/sunrise.jsp), based on the longitude and latitude of the relevant town as specified in section 12.2.4(b).

(c) The MC must ensure that the period that the load is operated at dimmed wattage during a TI and the period that the load is operated at full wattage during a TI are calculated as follows:
Trading Interval | Period load is switched on |
--- | --- |
For the TIs commencing after sunset and finishing prior to sunrise | Period dimmed wattage is switched on = 1 |
For the TIs commencing after sunrise and finishing prior to sunset | Period full wattage is switched on = 1 |
For the TI during which sunset occurs | (Period dimmed wattage switched on) = \( \frac{(\text{End time of TI}) - (\text{Time of sunset})}{30} \)  
(Period full wattage switched on) = 1 - \( \frac{(\text{End time of TI}) - (\text{Time of sunset})}{30} \) |
For the TI during which sunrise occurs | (Period dimmed wattage switched on) = \( \frac{(\text{Time of sunrise}) - (\text{Start time of TI})}{30} \)  
(Period full wattage switched on) = 1 - \( \frac{(\text{Time of sunrise}) - (\text{Start time of TI})}{30} \) |

(d) Should testing on the operation of photoelectric cells by an independent party, agreed to by the MC, affected Registered Participants, AEMO and relevant End User, indicate that the on/off times for an Unmetered Device controlled by a photoelectric cell are influenced materially and consistently by other variables, AEMO shall revise this Procedure accordingly.

12.5.5. Timer control

(a) If the on/off times for the dimming operation is controlled by a timer:

(i) On time = ON time set on timer (dimming operation ON)

(ii) Off time = OFF time set on timer (dimming operation OFF)

(b) The MC must ensure that the period that the load is switched on during a TI is calculated as follows:

| Trading Interval | Period load is switched on |
--- | --- |
For the TIs commencing after on time and finishing prior to off time | Period dimmed wattage is switched on = 1 |
For the TIs commencing after off time and finishing prior to on time | Period full wattage is switched on = 1 |
For the TI during which the on time occurs | (Period dimmed wattage switched on) = \( \frac{(\text{End time of TI}) - (\text{On time})}{30} \)  
(Period full wattage switched on) = 1 - \( \frac{(\text{End time of TI}) - (\text{On time})}{30} \) |
For the TI during which the off time occurs | (Period dimmed wattage switched on) = \( \frac{(\text{Off time}) - (\text{Start time of TI})}{30} \)  
(Period full wattage switched on) = 1 - \( \frac{(\text{Off time}) - (\text{Start time of TI})}{30} \) |

13. SUBSTITUTION FOR TRANSFER

13.1. Application

Sections 13.2 and 13.3 apply during a RoLR Event or where a Jurisdiction has requested AEMO to undertake End Use transfers requiring Substitutions.

13.2. Manually Read Interval Metering Installations

13.2.1. Mandatory Requirements

For Manually Read Interval Metering Installations affected by a RoLR Event, the MDP must ensure that:
(a) the correct management of the NMI Datastream status for the connection points concerned that meets Jurisdictional requirements for settlements and profile preparation;

(b) metering data is provided to the Current FRMP up to the transfer date;

(c) metering data is provided to the New FRMP from the transfer date which may include provision of a new Estimation;

(d) Estimations are undertaken in accordance with Section 4; and

(e) all substituted metering data and estimated metering data is replaced by Actual Metering Data.

13.2.2. Optional

For Manually Read Interval Metering Installations affected by a RoLR Event, the MDP may Substitute the metering data up to the transfer date in order to facilitate End User billing. Notification to the LNSP, LR, the Current FRMP and New FRMP is in MDFF, with the following configuration:

(a) utilise a reason code of ‘27’, with an entry in the free text field of ‘AEMO directed substitution’; and

(b) utilise a transaction code of ‘N’.

13.3. Manually Read Accumulation Metering Installations

For Manually Read Accumulation Metering Installations, the MDP must:

(a) ensure the correct management of the NMI Datastream status for the connection points concerned that meets Jurisdictional requirements for settlements and profile preparation;

(b) ensure that metering data is provided to the Current FRMP up to the transfer date;

(c) provide the necessary substituted metering data labelled with an ‘F’ quality flag;

(d) ensure that metering data is provided to the New FRMP from the transfer date, which may include provision of a new Estimation;

(e) ensure Estimations are undertaken in accordance with section 5;

(f) calculate the final substituted metering data in accordance with section 5;

(g) notify the LNSP, LR, the Current FRMP and New FRMP for the connection point of the Substitution. Notification is via the metering data file in MDFF with the following configuration:

(i) a reason code of ‘27’;

(ii) a transaction code of ‘N’;

(h) The MDP must Validate the final substituted metering data, re-calculate and update the metering data where:

(i) the final Substitution is found to be greater than the Actual Metering Data when next obtained; or

(ii) following consultation and agreement with the Current and New FRMP, the LR and LNSP for the connection point a new agreed value as per Section 6.4.3 (type 64) must be provided.
