1 Disclaimer

This document is made available to you on the following basis:

a) **Purpose** - This report has been prepared by the Australian Energy Market Operator Limited (AEMO) for the sole purpose of providing information on the operation of the National Electricity Market in accordance with clause 4.18.15 of the National Electricity Rules.

b) **No Reliance or warranty** – This report contains data provided by third parties and might contain conclusions or forecasts and the like that rely on that data. This data is included “as is” and might not be free from errors or omissions. While AEMO has used due care and skill, AEMO does not warrant or represent that the data, conclusions, forecasts or other information in this report are accurate, reliable, complete or current or that they are suitable for particular purposes. You should verify and check the accuracy, completeness, reliability and suitability of this report for any use to which you intend to put it, and seek independent expert advice before using it, or any information contained in it.

c) **Limitation of liability** - To the extent permitted by law, AEMO and its advisers, consultants and other contributors to this report (or their respective associated companies, businesses, partners, directors, officers or employees) shall not be liable for any errors, omissions, defects or misrepresentations in the information contained in this report, or for any loss or damage suffered by persons who use or rely on such information (including by reason of negligence, negligent misstatement or otherwise). If any law prohibits the exclusion of such liability, AEMO’s liability is limited, at AEMO’s option, to the re-supply of the information, provided that this limitation is permitted by law and is fair and reasonable.

2 Introduction

AEMO is required to maintain the power system frequency and time deviation within the limits specified in the frequency operating standards determined for the mainland and the Tasmania Region by the Reliability Panel. This document reports on the frequency and time deviation performance observed during July 2011 in all regions of the NEM. Regions QLD, NSW, VIC and SA will be referred to as the mainland regions throughout the report.

The frequency operating standards for the mainland regions and the Tasmania region are available on the AEMC web site.

The analysis of the delivery of slow raise service, slow lower service, delayed raise service and delayed lower service presented in this report are based on 4-second resolution data. Data for mainland regions is sourced from the Sydney PI server and data for Tasmania region is sourced from the Brisbane PI server. The analysis of fast raise service and fast lower service delivered is based on high-speed (50-millisecond or higher resolution) data and is only presented in this report for events where the appropriate data is available.

Table 1 below summarises events in the mainland and Tasmanian regions for the month July 2011 with frequency excursions outside the normal operating frequency band. Any events in Table 1 that are identified with frequency excursions that did not meet the frequency operating standards are evaluated in section 4 of the report.

---

## Summary of Events

4 Events in the Mainland and Tasmania Regions that did not meet the Frequency Operating Standards

In this section, details are provided of those events identified in Table 1 as not meeting the frequency operating standard applicable to each event.

4.1 Frequency Events in Mainland Region

There were no events recorded in Mainland Region that did not meet the Mainland Frequency Operating Standards from those identified in Table 1 during July 2011.

4.2 Low Frequency Events in Tasmania

There were five Low Frequency Normal Condition Events from Table 1 recorded in Tasmania during July 2011 that resulted in frequencies below 49.75 Hz. All of these events listed in Table 2 did not meet the Tasmania Frequency Operating Standards.

Table 2: Low Frequency Normal Condition Events (No Contingency) in the Tasmania region that did not meet the Tasmania Frequency Operating Standards.

4.2.1 Event: 02/07/2011 11:19:36

For the Normal (Non-Contingency) low frequency event on 2nd July 2011 in Tasmania, Figure 1 shows that the Tasmania region frequency exceeded the Tasmania Frequency Operating Standards and was outside the normal operating band for 8 seconds. One Tasmanian generating unit suddenly dropped in generation which contributed to the frequency excursion. Compared to the enabled slow raise and delayed raise FCAS, a zero amount was delivered as shown in Figure 2. The flow across Basslink was approximately 112 MW towards Victoria during the time of the frequency excursion. Basslink frequency controller did not deliver any further FCAS from Mainland to Tasmania during this event. The frequency excursion was not sufficient to trigger switched controllers to deliver delayed FCAS during the event. Frequency fell to a minimum of 49.74 Hz in the Tasmania region. The amount of Fast Raise services delivered was not calculated since 50 ms data was not requested for this event.
Figure 1: Low Frequency Normal Event in Tasmania refer to item 1 in Table 2 with the frequency exceeding the Tasmania Frequency Operating Standard.

Figure 2: FCAS response to Normal (Non-Contingency) Low Frequency Event on 2nd July 2011.
For the low frequency events on 29 July 2011, please refer to “Power System Operating Incident Report: Violation of the Frequency Operation Standards in Tasmania on 29 July 2011” for detailed analysis which can be found in AEMO’s website\(^3\).

4.2.2 Events: 29/07/2011 01:57:12

For the Non-Contingency low frequency event on 29\(^{th}\) July 2011 in Tasmania, insufficient FCAS was delivered to maintain the Tasmanian frequency within the Tasmania Frequency Operating Standards. Basslink did not follow dispatch target which contributed to the frequency excursion. Compared to the enabled slow raise and delayed raise FCAS, an amount of only about 25% was delivered as shown in Figure 4. The flow across Basslink was approximately 47 MW towards Victoria during the time of the frequency excursion. Since Basslink cannot transfer FCAS where the provision of the FCAS would cause the Basslink flow to enter the no-go zone, the FCAS transfer from Basslink would have been limited during this time. The frequency excursion was not sufficient to trigger switched controllers to deliver delayed FCAS during the event. Frequency fell to a minimum of 49.5 Hz in the Tasmania region. The Tasmania frequency as shown in Figure 3 below exceeded the Tasmania Frequency operating Standards and was outside the normal operating band for 956 seconds. The amount of Fast Raise services delivered was not calculated since 50 ms data was not requested for this event.

![Figure 3: Low Frequency Normal Event in Tasmania](image)

Figure 3: Low Frequency Normal Event in Tasmania refer to item 2 in Table 2 with the frequency exceeding the Tasmania Frequency Operating Standard

Figure 4: FCAS response to Normal (Non-Contingency) Low Frequency Event on 29th July 2011.

4.2.3 Events: 29/07/2011 03:17:56

For the Non-Contingency low frequency event on 29th July 2011 in Tasmania, insufficient FCAS was delivered to maintain the Tasmanian frequency within the Tasmania Frequency Operating Standards. Basslink did not follow dispatch targets which contributed to the frequency excursion. Compared to the enabled slow raise and delayed raise FCAS, some slow raise and delayed raise FCAS was delivered by some units providing a negative response as shown in Figure 6. The flow across Basslink was approximately 50 MW towards Victoria during the time of the frequency excursion. Since Basslink cannot transfer FCAS where the provision of the FCAS would cause the Basslink flow to enter the no-go zone, the FCAS transfer from Basslink would have been limited during this time. The frequency excursion was not sufficient to trigger switched controllers providing delayed FCAS during the event. Frequency fell to a minimum of 49.16 Hz in the Tasmania region. The Tasmania frequency as shown in Figure 5 below was outside the Tasmania Frequency operating Standards for 584 seconds. The amount of Fast Raise services delivered was not calculated since 50 ms data was not requested for this event.

Figure 5: Low Frequency Normal Event in Tasmania refer to item 3 in Table 2 with the frequency exceeding the Tasmania Frequency Operating Standard
4.2.4 Events: 29/07/2011 04:55:00

For the Non-Contingency low frequency event on 29th July 2011 in Tasmania, insufficient FCAS was delivered to maintain the Tasmanian frequency within the Tasmania Frequency Operating Standards. Basslink did not follow dispatch targets which contributed to the frequency excursion. Compared to the enabled slow raise FCAS, some slow raise FCAS was delivered by some units providing a negative response as shown in Figure 8. The flow across Basslink was approximately 50 MW towards Victoria during the time of the frequency excursion. Since Basslink cannot transfer FCAS where the provision of the FCAS would cause the Basslink flow to enter the no-go zone, the FCAS transfer from Basslink would have been limited during this time. The frequency excursion was not sufficient to trigger switched controllers providing delayed FCAS during the event. Frequency fell to a minimum of 49.62 Hz in the Tasmania region. The Tasmania frequency as shown in Figure 7 below was outside the Tasmania Frequency operating Standards for 340 seconds. The amount of Fast Raise services delivered was not calculated since 50 ms data was not requested for this event.

Figure 6: FCAS response to Normal (Non-Contingency) Low Frequency Event on 29th July 2011.

Figure 7: Low Frequency Normal Event in Tasmania refer to item 3 in Table 2 with the frequency exceeding the Tasmania Frequency Operating Standard

Figure 8: FCAS response to Normal (Non-Contingency) Low Frequency Event on 29th July 2011.
5 Statistical Analysis

With exception of load, generation, network, separation and multiple contingency events which are excluded, the frequency distribution for the mainland and Tasmanian regions were within the frequency operating standards in the month of July 2011.

Frequency in the mainland regions was within the range 49.92 Hz - 50.08 Hz for 99% of the time. The frequency was within the range 49.75 Hz – 50.25 Hz for 100% of the time. The mean value of frequency during July 2011 was 50 Hz with a standard deviation of 0.030 Hz.

Frequency in the Tasmania region was within the range 49.90 to 50.10 Hz for 99% of the time. The frequency was within the range 49.75 Hz – 50.25 Hz for 99.9% of the time. The mean value of frequency during July 2011 was 50 Hz with a standard deviation of 0.038 Hz.

5.1.1 Daily Frequency Standard Deviation

Figure 9 and Figure 10 below plot the daily standard deviation of the Mainland and Tasmanian frequency for the past 13 months, and do not exclude contingency events.

![Figure 9: Daily standard deviation of mainland frequency](image-url)
5.1.2 Time of day Analysis

This section details the standard deviation of system frequency on a monthly and daily basis. Figure 11 and Figure 12 show the average half-hourly standard deviation of the Mainland regions and Tasmania frequency for May, June and July 2011. The effects of contingency events have not been filtered from this time of day analysis.

The theoretical limit of 0.049 Hz shown in Figure 11 and Figure 12 would ensure that 99% of observed values were in the range 49.85 - 50.15 Hz with a very small possibility of being less than 49.75 Hz and greater than 50.25 Hz. (This assumes that the frequency distribution follows an ideal normal distribution).
Figure 11: Daily profile of standard deviation for the frequency in the Mainland regions

Figure 12: Daily profile of standard deviation for the frequency in Tasmania
6 Accumulated Time Deviation

The frequency operating standards require that the accumulated time deviation be maintained within the range ± 5 seconds in mainland regions and ± 15 seconds in Tasmania.

For a separation event there is no requirement in the frequency operating standards that time deviation be maintained within the ranges specified above.

The range of accumulated time deviations recorded throughout the NEM during July 2011 is provided in Table 3.
